Annotator recruitment was done on Prolific. I picked 30 first responses from visitors and put them into a google form. The compensation was $1.20 for completing the annotation task. The estimated time was 6 minutes.

I accidentally was able to get the responses of 5 for the price of 3. Because I have set one of the questions as my quality control measure. I said in the instructions that if you face a response with only “hi”, you should pick “renter”, otherwise you will be disqualified. But out of the 3 responses only 1 picked “renter” instead of “other”. So I rejected them and got 2 more responses. They also happen to pick “renter”. So I guess my attention checking question was too difficult and maybe it’s not enough time for them to go through all the instructions. All but one annotator finished within 5 minutes and the one another is taking 11 minutes and is the one following the instructions. Learning from this, I should make the attention checking instruction more obvious. I checked on the responses such that the “failed” responses are still decent, so I decided to still keep them as my data. I feel bad for rejecting them, maybe I should have made the attention checking question more obvious.

I then manually change the response of “hi” all to “other” (which is obviously the correct answer). And applied the majority rule for all the answers. Out of 30 responses, only 1 question requires resolution, as it had 2 “renter”, 2 “other”, and 1 “buyer” answers. I decided it should be “other” since it’s not clear what the visitor wants to do. They could be buying or renting.

Summary:

1. Number of Items: 30
2. Number of annotators per item: 5
3. Total judgments: 150
4. Category counts for the final labels: buyer: 19 seller: 1, renter: 3, other: 7

5. Quality-control procedure: attention question
6. Adjudication procedure: I am the tie breaker for 1 question
7. Annotation difficulties: Prolific only allows 2 rejections per study for me. So my quality assurance measure did not work as well.
